

BRAKE DEVICE FOR A LACE

Abstract of the invention

5

The brake device (30) for a lace (2), of a boot (31), sliding in a base part (1) linked to the boot (31), comprises a lever (3) articulated on the base part (1),
10 returned by an elastic means (11) into a position of contact with the lace (2) preventing the sliding of the lace (2) in one direction by pressing. It is noteworthy in that the lever (3) has holding means (15, 16) enabling it to maintain a second, stable position
15 allowing the sliding of the lace (2) in both directions. This device (30) makes the action for opening the boot more convenient.
